

Flexica

Office Partitions

Technical guide

Flexica is the most flexible office partition on the market and the wide range of solutions makes it suitable for office environments, focusing on flexibility.

Flexica has a narrow horizontal transom that divides the wall into panels. There are many solutions within the Flexica range and the panels can either be glass, plasterboard or MDF panels covered with vinyl, veneer or steel.

Apart from being a flexible, relocatable office partition, Flexica can be combined with other Triplan product ranges which adds to the flexibility since the system can be adapted to any change made inside the building. Quick noise- and dust-free assembly and relocation without the use of special-purpose tools.

Flexica is available in wall thickness from 75 to 165mm with an Rw sound reduction from 28 to 54 dB. Tests have shown that Flexica meets fire requirements for up to two hours. Please, refer to the technical specifications for further details.

Module system

Like all product lines in the Triplan system, Flexica is a modular office partition. The standard widths of the wall modules are 300, 450, 600, 900 or 1200mm, but the modules are also made to measure in widths from 200 to 1500mm. The standard widths of the door modules are 900 and 1000mm for single doors and 1200, 1500 and 1730mm for double doors.

Glass modules

Modules are available with single or double glazing. Using the Flexica venetian blind solution, open, bright environments can quickly be shielded to create more discreet surroundings. Flexica is available with different glass types, for example in sun-screened, screen-printed and hardened glass.

Modules with panels

Panels for modules are available in different surfaces, such as MDF boards or plasterboard covered with wallpaper, metal or veneer, or in custom made surfaces. Flexica offers many solutions

Joints

Omega sections are the standard vertical joint sections for Flexica. The narrower Aspira section is available for plasterboard or panel partitions, as required.

Shelves, cabinets, rails for whiteboards, etc. can be hung onto the sections.

Combined Triplan systems

Flexica consists of the same basic components as the other product ranges in the Triplan system and can therefore be combined with these ranges; for example when a panel wall needs to be extended, or with Flexica facing the corridor and Ventura facing the office.

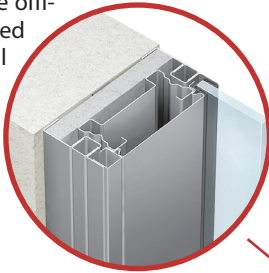

Flexica - Joints

A wide range of joint sections for modules, panels and doors as well as for fixing to ceilings, walls and floors are available for Flexica.

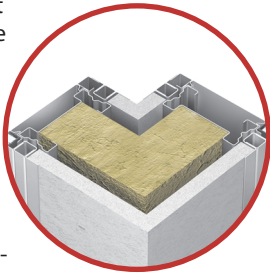

The simplest joint sections are shown here.

Fixing to walls

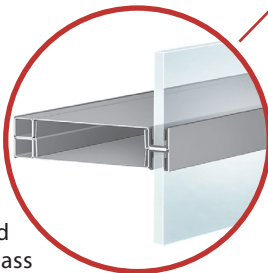

Fixing to the existing walls of the building, perpendicular to them or as end-to-end solutions. Here, the office partition is fixed to the existing wall using a close-fitting F-section.

**Corner solutions**

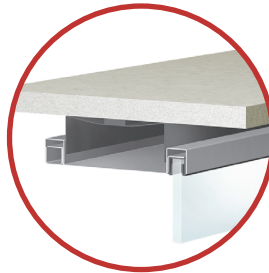

30°, 45°, 60° and 90° corner joint sections are available as well as a flexible corner solution with variable angles. The 90° sections also come in several, rounded versions.

**Transoms**

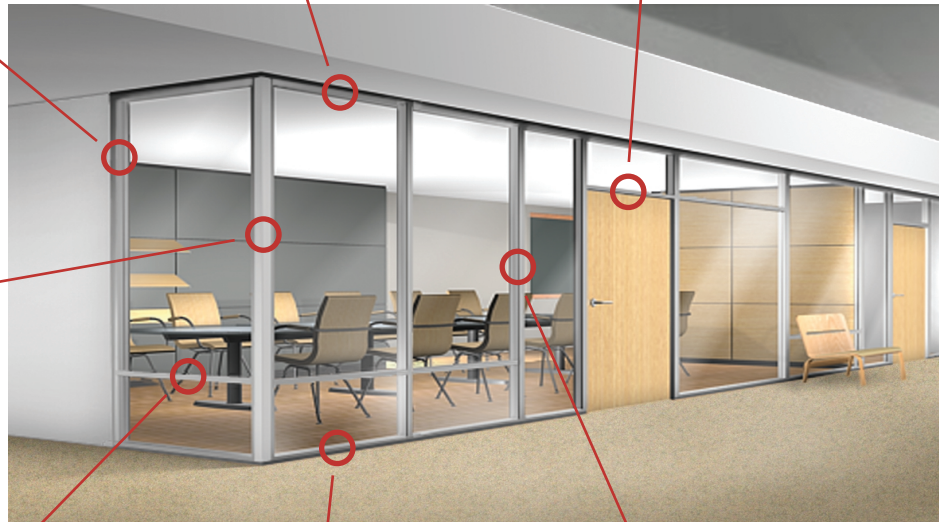

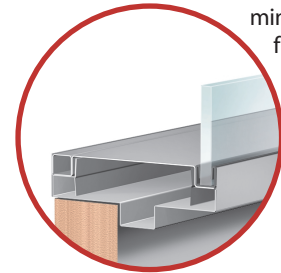

The height of the modules can be divided into boards and glass panels. Design as required.

**Top solutions**

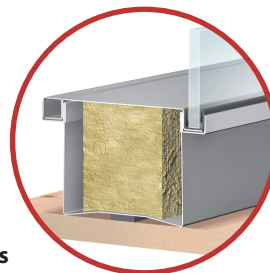

Fixing to the ceiling using simple and stable structures. Also solution for suspended ceilings. The solution shown is designed with a shadow section.

**Door solutions**

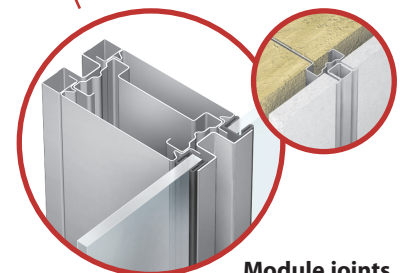

The Flexica range allows integration of a variety of frame and door solutions, such as glass and wooden doors in custom made dimensions and with steel, aluminium and wooden frames.

**Base solutions**

Fixing to floors using simple and stable structures. The solution shown is provided with a 60mm base track. Levelling solutions for sloping floors as well as a variety of skirtings are available.

**Module joints**

Omega sections are the standard vertical joint sections for Flexica. The narrower Aspira section is available for plasterboard or panel partitions, as required. The joint can be closed using an infill section or an optional cover cap.
